# What is an Antibiogram

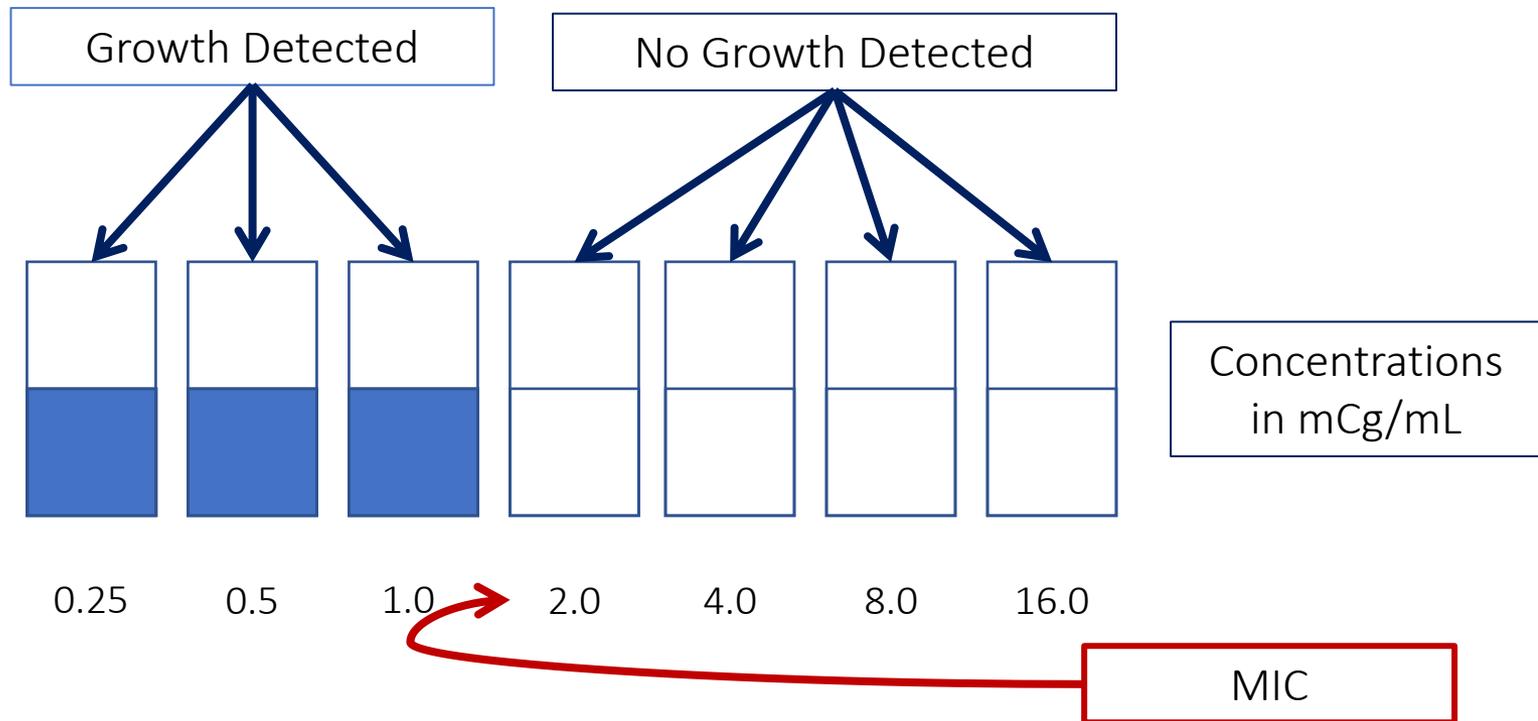

- A summary of antimicrobial susceptibility testing for a specific/unique care setting or population of patients.
- Clinically isolate micro-organisms are listed against and a panel of anti-infectives in table form summarizing the percentage of susceptible organisms to anti-infective drugs.
- Data summary period is typically one year but may vary.

# What is the Intended Use

- Optimizing empiric antimicrobial therapy, thereby influencing outcomes.
- Tracking the development of resistance within and institution, patient population, clinical setting or geographic area over time, allowing for adaptations in anti-infective use to prevent or reverse antimicrobial resistance.
- Tracking resistance is limited by breakpoints, antibiogram does not track specific changes in MIC over time unless threshold for resistance is surpassed.
- Summarizing year-over-year susceptibility patterns for sentinel organisms (*Strep pneumoniae*).

# Defining MIC

- MIC – minimum inhibitory concentration

# What are Breakpoints?

- Breakpoints are determined by laboratory standard organizations utilizing MIC values
- Organisms can be defined as susceptible or resistant
- Susceptible organisms should respond to standard dosing regimens of antimicrobials
- Methods used to determine susceptibility breakpoints can differ
- Historically many different entities recommended breakpoints
  - Pharmaceutical companies
  - FDA
  - Laboratory oversight bodies
- Breakpoint questions
  - How are breakpoints determined?
  - Who defines susceptible?
  - Are definitions consistent in all countries?
  - Do breakpoints change over time?

# Standards Organizations

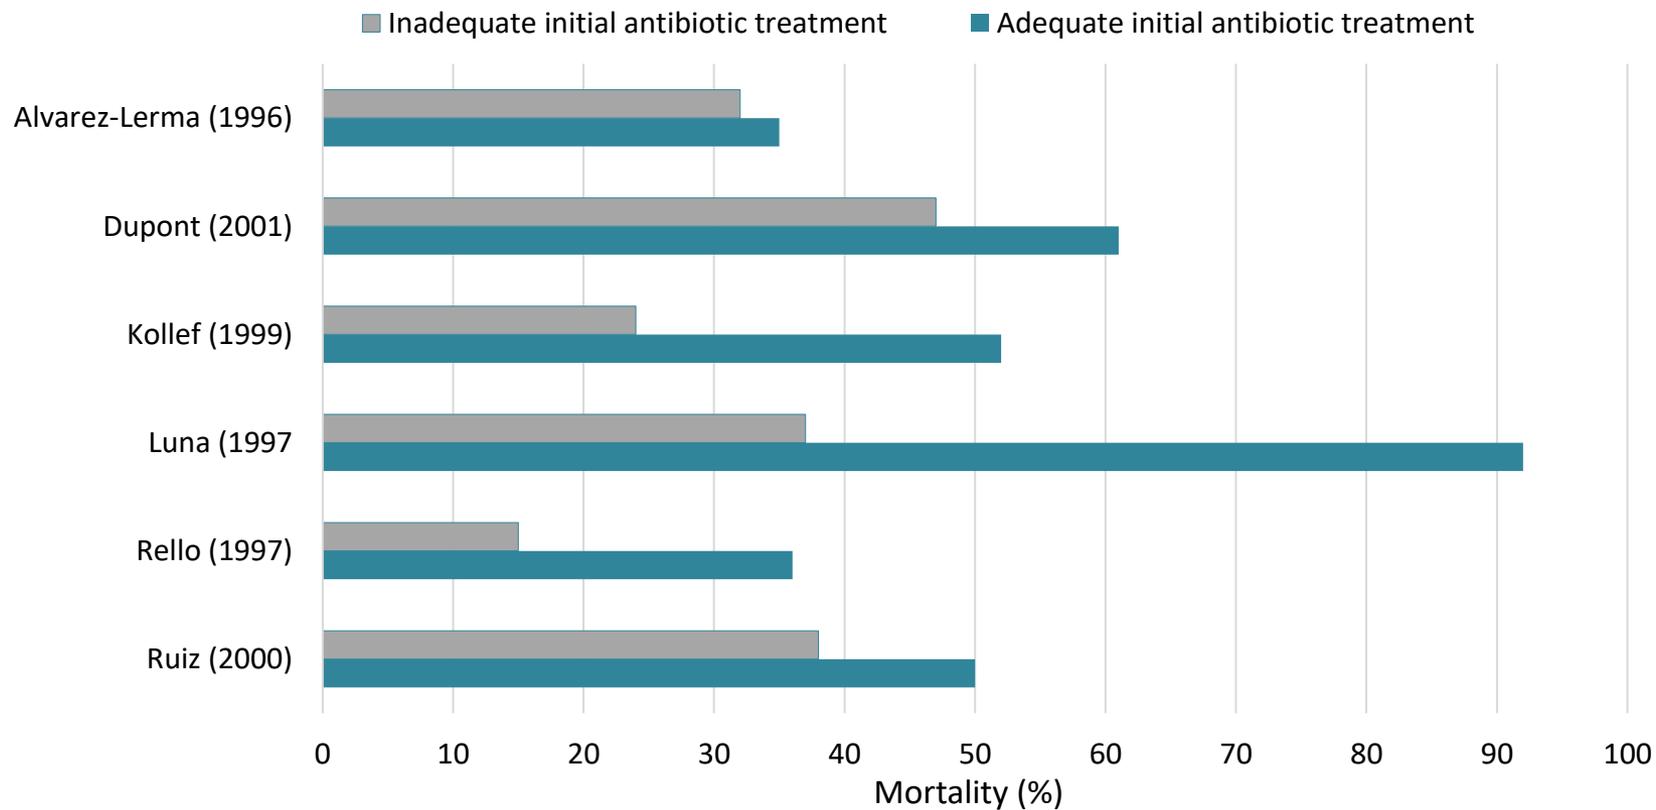

- FDA
- CLSI
- EUCAST (formed 1997, harmonized breakpoints in Europe, ongoing)
- USCAST (formed 2014, liaison to CLSI and EUCAST)

# Breakpoint Questions

How are breakpoints determined?

- Cumulative MIC distributions
- Historically breakpoints viewed as static and necessary for less industry and clinical disruption
  - Pharma wants favorable susceptibilities to drugs to drive use
  - Microbiology testing companies do not want to change assays frequently
  - Desire for concrete answers
- May not reflect ability
  - achieve antimicrobial concentrations necessary for adequate microbiological or clinical response
  - Prevent emergence of resistance

# Antibiogram Requirements

- Accreditation/regulatory requirements
- Specific recommendations guidance: CLSI M-39
  - Current 5<sup>th</sup> edition, published Jan 24, 2022
- EMR Pitfalls
  - Screening for quality assurance if utilizing data from surveillance software (WHONET, TheraDoc) or EMR (EPIC)

# Creating an Antibigram

- Who makes an antibiogram
  - Laboratory
  - Microbiologist
  - Pharmacist
  - Physician
  - Infection prevention practitioner
- Optimal collaboration
  - **Microbiologist**
  - **Pharmacist / ID Pharmacist**
  - **ID Physician**

# Antibiogram Distribution and Education

- Individuals
  - Clinician
  - Microbiologist
  - Pharmacist
  - Infection prevention practitioner
- Care Environments
  - Acute Care (Inpatient, Units, ED, etc)
  - Post-acute (LTAC, LTC, etc)
  - Outpatient Practices (Dialysis, Physician offices, immediate care)
    - Patient type vs community specific
  - Community or region

‡ Imipenem susceptibility predicts Meropenem susceptibility

Green = greater than or equal to 85% of isolates susceptible

Yellow = 75% to 84% of isolates susceptible

Red = less than 75% of isolates susceptible

\* less than 30 isolates, interpret with caution, as small numbers may bias the group susceptibilities

# Critical Data for Antimicrobial Treatment Decisions

- Antibigram - most active agent(s) for clinical setting or pathogen

- Drugs concentrations at the infection site

- Drugs optimal dosing characteristics

- Drugs risk for selecting resistance

- Drug risk for adverse effects

- Cost

Additional doses Review and dependent on culture results may require additional doses and/or assessment of serum concentrations.  
Add MRSA Coverage: Prior MRSA isolation from respiratory tract previous 12 months, hospitalization AND parenteral antibiotics previous 90 days, post-influenza. Mild to moderate pneumonia with MRSA risk factors may be covered empirically with doxycycline.  
Add at risk Pseudomonas/MRSA coverage: Prior Pseudomonas/MRSA isolation from respiratory tract previous 12 months, hospitalization AND parenteral antibiotics previous 90 days, post-influenza. May consider in LTC/LTAC patient if recent < 3 day broad spectrum antibiotic(s) AND history of being using (AKS) score > 12.3 at baseline (moderate disability patient). Mild to moderate pneumonia with MRSA risk factors may be covered empirically with doxycycline if MRSA empiric coverage. Cefazolin, ulcers, ulcer with purulent drainage, penetrating trauma (IV drug use), or patient with concurrent evidence of MRSA infection elsewhere or history of MRSA.  
Duration of Therapy: Assess patient and stop therapy when clinically improved.

# Nursing Facility AntibioGrams

- Typical low number of isolates
  - Expanded time frame (rolling 2-year data)
  - Expand organism analysis to genus level
- Consider local resistance patterns to supplement data
  - Preference surrounding facilities sharing patients (e.g., local referral acute care hospital)
  - Utilize to validate resistance patterns in local area
- Consider limitations

# Additional Information Included

- Empiric recommendations
  - Disease specific based on antibiogram
  - Alternatives due to allergy
- Optimal Dosing Guidelines
- Antimicrobial costs
- Clinical Pearls based on information presented
- Molecular testing results
  - Cumulative results
  - Recommendations

# Summary Slide

- Antibigrams summarize antimicrobial susceptibility testing within care settings
- Challenges for creating accurate antibigrams include accurate data from micro lab, error-inducing interfaces between microdata collection systems and EMR, lack of microbiologic culture testing

# Summary Slide

- Functional antibiograms:
  - Track and identifying organism-specific antimicrobial resistance/ resistance patterns
  - Assisting empiric therapy choices
  - Assisting in treatment order set design for unique clinical settings that are informed by prevailing resistance patterns
  - Assist in determining causes of antimicrobial resistance when combined with antimicrobial use (AU) data
  - Informing prescribers, especially when combined with education
- Use optimized when provided in various formats (pocketcard, electronic, etc) and combined with recommendations that emphasize use of appropriate antimicrobials
