What is infant mortality?

- Infant mortality is defined as the death of a baby before his or her first birthday
- The infant mortality rate (IMR) is the number of babies who die in the first year of life, per 1,000 live births
- If Indiana (7.2) had the same IMR as the U.S (5.6), about 130 more babies would have survived in 2022

2018 – 2022				
HOSPITAL REGION	IMR	NH WHITE IMR	NH BLACK IMR	HISPANIC IMR

* Rates based on counts fewer than 20 are considered unstable and should be interpreted with caution.
 ** Rates based on counts fewer than 5 were suppressed.

Disparities Defined

- In 2022, Non-Hispanic (NH) Black babies in Indiana were more than twice as likely to die in the first year of life than NH White babies
- In Indiana in 2022, the NH White IMR was 5.6 per 1,000 live births, the Hispanic IMR was 7.9 per 1,000 live births, and the NH Black IMR was 14.1 per 1,000 live births
- If NH Black infants had the same IMR as NH White infants, 84 additional NH Black infants would have survived in 2022
- There is also a disparity at the national level. In the United States in 2022, the NH White IMR was 4.5, the Hispanic IMR was 4.9, and the NH Black IMR was 10.9. NH Black babies in the United States are more than two times likely to die before their first birthday than NH White babies.

These disparities have been persistent in Indiana and the nation.
